GROWTH HORMONE SECRETAGOGUES

Background of the Invention

Growth hormone is a secretory protein of the pituitary gland of animals having wide ranging developmental effects on the organism. Artificial manipulation of growth hormone levels has been demonstrated to have significant therapeutic utility. Human growth hormone supplementation has been shown to be an effective treatment for growth hormone deficiencies and their related disease states in humans. Apart from this application, studies have uncovered new and significant properties of growth hormone which lend further importance to the ability to control growth hormone levels. For example, recent clinical studies indicate that growth hormone supplementation may be useful in combating the maladies of aging in humans. Elevated growth hormone levels in animals have been shown to result in increased lean muscle mass. One application of this latter observation could result in higher production of leaner meat products or in the production of larger and/or stronger animals.

While growth hormone is naturally produced by the pituitary gland, the secretion of growth hormone into the bloodstream is controlled by a second protein, Growth Hormone Releasing Factor (GRF). This hormone is also commonly known in the art as somatocrinin, Growth Hormone Releasing Hormone (GRH), and Growth Releasing Hormone (GRH).

There are two ways to approach the problem of increasing circulating levels of growth hormone: (1) increase the level of human growth hormone in the organism directly or (2) increase the organism's natural tendency to produce growth hormone. The latter strategy may be achieved via supplementation with GRF. GRF has been demonstrated to increase the circulatory levels of growth hormone in vivo. (Rivier, et al., Nature (London), 300:276 (1982). The effect of GRF, including structural analogs thereof, on 10 growth hormone production has been widely studied. A primary obstacle to the use of GRF as a direct supplement is its short lifespan in vivo. L.A. Frohman, et al., Journal of Clinical Investigation, 78:906 (1986). More potent and/or longer lasting GRF molecules are therefore desirable 15 for the development of effective human therapeutic or animal husbandry agents.

The structure of GRF has been modified in numerous ways resulting in longer lasting and/or more potent GRF analogs. It has been demonstrated that the first 29 amino acids from 20 the N-terminus are sufficient to retain full GRF activity. Speiss, et al., Biochemistry, 21:6037 (1982). One strategy has been the incorporation of novel D-amino acid residues in various regions of the GRF molecule. V.A. Lance, et al., Biochemical and Biophysical Research Communications, 119:265 25 (1984); D.H. Coy, et al., Peptides, 8(suppl. 1):49 (1986). Another strategy has modified the peptide backbone of GRF by the incorporation of peptide bond isosteres in the Nterminal region. D. Tourwe, Janssen. Chim. Acta, 3:3 30 (1985); S.J. Hocart, et al., Journal of Medicinal Chemistry, 33:1954-58 (1990). A series of very active analogs of GHRH is described in European Patent Publication 511,003, published October 28, 1992.

In addition to the actions of GHRH there are various ways known to release growth hormone. For example,

20

30

...

.

chemicals such as arginine, L-3,4-dihydroxyphenylalanine (L-DOPA), glucagon, vasopressin, and insulin-induced hypoglycemia, as well as activities such as sleep and exercise, indirectly cause growth hormone to be released from the pituitary by acting in some fashion on the hypothalamus, perhaps either to decrease somatostatin secretion or to increase the secretion of GHRH.

In cases where increased levels of growth hormone are desired, the problem has generally been solved by providing exogenous growth hormone or by administering GHRH, or a related peptidyl compounds which stimulates growth hormone production or release. In either instance the peptidyl nature of the compound has necessitated that it be administered by injection.

Other compounds have been developed which stimulate the release of endogenous growth hormone, such as analogous peptidyl compounds related to GHRH. These peptides, while considerably smaller than growth hormones are still susceptible to metabolic instability.

Administration of the hexapeptide growth hormone releasing peptide-6 (GHRP-6) results in the secretion of growth hormone in many species, including humans. This peptide is one of a series of synthetic peptides, the structures of which were based on the pentapeptide Metenkephalin. It has been shown that GHRP binds specifically to the pituitary, although the binding does not involve the opioid, GHRH, or the somatostatin receptors.

In recent years significant efforts have been taken to develop nonpeptidyl analogs of this series of compounds. Such compounds, termed growth hormone secretagogues, should be orally bioavailable, induce the production or release of growth hormone, and act in concert, or synergistically with GHRH.

Representative growth hormone secretagogues are
disclosed in United States Patent 3,239,345; United States
Patent 4,036,979; United States Patent 4,411,890; United

States Patent 5,206,235; United States Patent 5,248,841; United States Patent 5,310,737; United States Patent 5,310,017; European Patent Publication 144,230; European Patent Publication 513,974; Patent Cooperation Treaty Patent 5 Publication WO 94/07486; Patent Cooperation Treaty Patent Publication WO 94/08583; Patent Cooperation Treaty Patent Publication WO 94/13696; United States Serial Number 08/704,494, filed August 20, 1996, United States Serial Number 08/700, 206, filed August 20, 1996, and Science, 260:1640-1643 (1993).

United States Patent 5,206,235, issued April 27, 1993. describes a series of benzolactam compounds typified by the following structure.

15 These compounds have demonstrated clinical activity in humans in raising the growth hormone secretory levels. B.J. Gertz, Journal of Clinical Endocrinology and Metabolism, 77:1393-1397 (1993).

Another group of growth hormone secretagogues is described in Patent Cooperation Treaty Patent Publication WO 94/13696, published June 23, 1994. These compounds are typified by the following two structures.

The present invention provides a series of compounds that have activity as growth hormone secretagogues. These compounds are non-peptidyl in nature and are, therefore, more metabolically stable than growth hormone, growth hormone releasing hormone, or analogs of either of these proteins. The compounds employed in the present invention are preferred for human pharmaceutical uses as well as veterinary uses, particularly in cattle, swine, sheep, poultry and fish.

15 Summary of the Invention

The present invention relates to compounds of Formula I, as follows:

wherein R1 is C₆H₅CH₂OCH₂-, C₆H₅(CH₂)₃- or indol-3-ylmethyl; Y is pyrrolidin-1-yl, 4-C₁-C₆ alkylpiperidin-1-yl or NR2R2; R2 are each independently a C₁ to C₆ alkyl; R3 is 2-napthyl or phenyl para-substituted by W; W is H, F, CF₃, C₁-C₆ alkoxy or phenyl; and R4 is H or CH₃,

or a pharmaceutically acceptable salt or solvate thereof.

The present invention further relates to pharmaceutical formulations containing compounds of Formula I, alone or in combination with other growth hormone secretagogue compounds, and/or in combination with suitable bone-antiresorptive agents, and the use of said compounds and/or formulations at least for the increase in endogenous levels of growth hormone in a mammal.

The present invention yet further relates to methods for the treatment or prevention of a physiological condition which may be modulated by an increase in endogenous growth hormone, which method comprises administering to an animal in need of said treatment an effective amount of a compound of Formula I.

The present invention still further relates to processes for the preparation of compounds of Formula I.

Detailed Description

In a preferred embodiment, compounds of the present invention are those compounds of Formula I wherein R3 is a methyl group.

In another preferred embodiment, compounds of the present invention are those compounds of Formula I wherein Y is 4-methylpiperidin-1-yl.

It is also preferred that the stereochemistry, at the two chiral centers, of the compounds of Formula I is (R,R).

The terms and abbreviations used in the instant examples have their normal meanings unless otherwise designated. For example "oC" refers to degrees Celsius; "N" refers to normal or normality; "mmol" refers to millimole or millimoles; "g" refers to gram or grams; "ml" means milliliter or milliliters; "M" refers to molar or molarity; "MS" refers to mass spectrometry; "FDMS" refers to field desorption mass spectrometry; "UV" refers to ultraviolet spectroscopy; "IR" refers to infrared spectroscopy; and "NMR" refers to nuclear magnetic resonance spectroscopy.

As used herein, the term " C_1 - C_6 alkyl" refers to straight or branched, monovalent, saturated aliphatic chains of 1 to 6 carbon atoms and includes, but is not limited to, methyl, ethyl, propyl, isopropyl, butyl, isobutyl, t-butyl, pentyl, isopentyl, and hexyl. The term " C_1 - C_6 alkyl" includes within its definition the term " C_1 - C_4 alkyl".

"C₁-C₆ alkoxy" represents a straight or branched alkyl chain having from one to six carbon atoms attached to an oxygen atom. Typical C_1 -C₆ alkoxy groups include methoxy, ethoxy, propoxy, isopropoxy, butoxy, t-butoxy, pentoxy and the like. The term "C₁-C₆ alkoxy" includes within its definition the term "C₁-C₄ alkoxy".

The term "carboxy-protecting group" as used herein refers to substituents of the carboxy group commonly employed to block or protect the carboxy functionality while reacting other functional groups on the compound. Examples

20

-8-

of such protecting groups include methyl, ethyl, p-nitrobenzyl, p-methylbenzyl, p-methoxybenzyl, 3,4-dimethoxybenzyl, 2,4-dimethoxybenzyl, 2,4,6-trimethoxybenzyl, 2,4,6trimethylbenzyl, pentamethylbenzyl, 3,4-methylene-dioxybenzyl, benzhydryl, 4,4'-dimethoxy-benzhydryl, 2,2',4,4'tetramethoxybenzhydryl, t-butyl, t-amyl, trityl, 4-methoxytrityl, 4,4'-dimethoxytrityl, 4, 4', 4"-trimethoxytrityl, 2phenylprop-2-yl, trimethylsilyl, t-butyldimethylsilyl,
phenacyl, 2,2,2-trichloroethyl, 2-(di(n-butyl)methylsilyl)ethyl, p-toluenesulfonylethyl, 4-nitrobenzylsulfonylethyl,
allyl, cinnamyl, 1-(trimethylsilylmethyl)prop-1-en-3-yl, and
the like.

A preferred carboxy-protecting group for the practice of the present invention is methyl or ethyl. Further examples of these groups may be found in E. Haslam, supra, at Chapter 5, and T.W. Greene, et al., supra, at Chapter 5.

The term "amino-protecting group" as used herein refers to substituents of the amino group commonly employed to block or protect the amino functionality while reacting other functional groups on the compound. Examples of such amino-protecting groups include formyl, trityl, phthalimido, trichloroacetyl, chloroacetyl, bromoacetyl, iodoacetyl, and urethane-type blocking groups such as benzyloxycarbonyl, 4-phenylbenzyloxycarbonyl, 2-methylbenzyloxycarbonyl, 4-methoxybenzyloxycarbonyl, 4-fluorobenzyloxycarbonyl,

- 4-methoxybenzyloxycarbonyl, 4-fluorobenzyloxycarbonyl,
 4-chlorobenzyloxycarbonyl, 3-chlorobenzyloxycarbonyl,
 2-chlorobenzyloxycarbonyl, 2,4-dichlorobenzyloxycarbonyl,
 4-bromobenzyloxycarbonyl, 3-bromobenzyloxycarbonyl,
 4-nitrobenzyloxycarbonyl, 4-cyanobenzyloxycarbonyl,
- n-butoxycarbonyl, (NBoc) t-butoxycarbonyl, 1,1-diphenyleth-1-yloxycarbonyl, 1,1-diphenylprop-1-yloxycarbonyl,
 2-phenylprop-2-yloxycarbonyl, 2-(p-toluyl)-prop-2-yloxycarbonyl, cyclopentanyloxycarbonyl, 1-methylcyclopentanyloxycarbonyl, cyclohexanyloxycarbonyl, 1-methylcyclohexanyl-

15

20

25

30

oxycarbonyl, 2-methylcyclo-hexanyloxycarbonyl, 2-(4-toluyl-sulfonyl)-ethoxycarbonyl, 2-(methylsulfonyl)ethoxycarbonyl, 2-(triphenyl-phosphino)-ethoxycarbonyl, fluorenyl-methoxycarbonyl (FMOC), 2-(trimethylsilyl)ethoxycarbonyl, allyloxycarbonyl, 1-(trimethylsilylmethyl)prop-1-enyloxy-carbonyl, 5-benzisoxalylmethoxycarbonyl, 4-acetoxybenzyloxy-carbonyl, 2,2,2-trichloroethoxycarbonyl, 2-ethynyl-2-propoxycarbonyl, cyclopropylmethoxycarbonyl, 4-(decyloxy)-benzyloxycarbonyl, isobornyloxycarbonyl, 1-piperidyloxy-carbonyl, and the like; benzoylmethylsulfonyl group, 2-nitrophenylsulfenyl, diphenylphosphine oxide and like amino-protecting groups.

The amino-protecting group employed is usually not critical so long as the derivatized amino group is stable to the condition of subsequent reactions on other positions of the intermediate molecule, and may be selectively removed at the appropriate point without disrupting the remainder of the molecule including any other amino-protecting groups. A preferred amino-protecting group for the practice of the present invention is t-butoxycarbonyl (NBoc). Further examples of groups referred to by the above terms are described by E. Haslam, Protective Groups in Organic Chemistry, (J.G.W. McOmie, ed., 1973), at Chapter 2; and T.W. Greene and P.G.M. Wuts, Protective Groups in Organic Synthesis (1991), at Chapter 7.

The term "leaving group" (Q) refers to a group of atoms that is displaced from a carbon atom by the attack of a nucleophile in a nucleophilic substitution reaction. Suitable leaving groups include bromo, chloro, and iodo, benzenesulfonyloxy, methanesulfonyloxy, and toluenesulfonyloxy. The term "leaving group" (Q) includes activating groups.

The term "activating group" as used herein refers a leaving group which, when taken with the carbonyl (-C=O)

-10-

group to which it is attached, is more likely to take part in an acylation reaction than would be the case if the group were not present, as in the free acid. Such activating groups are well-known to those skilled in the art and may be, for example, succinimidoxy, phthalimidoxy, benzotriazolyloxy, azido, or $-0-CO-(C_4-C_7 \text{ alkyl})$.

The compounds used in the method of the present invention have two chiral centers. As a consequence of these chiral centers, the compounds of the present invention occur as diastereomers and mixtures of diastereomers. All asymmetric forms, individual isomers and combinations thereof, are within the scope of the present invention.

10

15

20

25

The terms "R" and "S" are used herein as commonly used in organic chemistry to denote specific configuration of a chiral center. The term "R" (rectus) refers to that configuration of a chiral center with a clockwise relationship of group priorities (highest to second lowest) when viewed along the bond toward the lowest priority group. The term "S" (sinister) refers to that configuration of a chiral center with a counterclockwise relationship of group priorities (highest to second lowest) when viewed along the bond toward the lowest priority group. The priority of groups is based upon their atomic number (in order of decreasing atomic number). A partial list of priorities and a discussion of stereochemistry is contained in Nomenclature of Organic Compounds: Principles and Practice, (J.H. Fletcher, et al., eds., 1974) at pages 103-120.

In addition to the (R)-(S) system, the older D-L system is also used in this document to denote absolute

30 configuration, especially with reference to amino acids. In this system, a Fischer projection formula is oriented so that the number 1 carbon of the main chain is at the top.

The prefix "D" is used to represent the absolute configuration of the isomer in which the functional

15

20

25

30

(determining) group is on the right side of the carbon atom at the chiral center and "L", that of the isomer in which it is on the left.

In order to preferentially prepare one optical isomer over its enantiomer, a number of routes are available. As an example, a mixture of enantiomers may be prepared, and then the two enantiomers may be separated. A commonly employed method for the resolution of the racemic mixture (or mixture of enantiomers) into the individual enantiomers is to first convert the enantiomers to diastereomers by way of forming a salt with an optically active acid or base. These diastereomers may then be separated using differential solubility, fractional crystallization, chromatography, or the like. Further details regarding resolution of enantiomeric mixtures may be found in J. Jacques, et al., Enantiomers, Racemates, and Resolutions, (1991).

During any of the following synthetic sequences it may be necessary or desirable to protect sensitive or reactive groups on any of the molecules concerned. This may be achieved by employing conventional protecting groups as described, supra.

The compounds of the present invention may be prepared by a number of routes, many of which are known to those of skill in the art. The particular order of steps to be employed in the synthesis of compounds of formula I is dependent upon the compound to be synthesized, the starting material employed, and the relative lability of the various substituted moieties. Examples of such synthetic routes may be found in Schemes I through IV provided below, as well as in the Examples.

One synthetic route to compounds of the present invention is provided in Scheme IA-IC below. The compounds of formula IV' and IV are commercially available, or may be prepared using techniques known in the art. A compound of

30

Formula IV may be prepared from a compound of Formula IV' through an intermediate acid chloride prepared by standard methods using thionyl chloride or oxalyl chloride. Treatment of the resulting acid chloride with a bromine 5 source, such as N-bromosuccinimide, followed by quenching of the acid chloride with ethanol, results in compounds of Formula IV. It is to be understood that the bromine group on the compound of Formula IV may in fact be any suitable leaving group (Q), as defined herein. This preparation is 10 provided below in Scheme IA.

wherein R is representative of E as defined in a compound of 15 Formula I above.

As shown in Scheme IB, the starting material further includes compounds of Formula V, which are commercially available, or may be routinely synthesized using techniques readily known in the art. Compounds of Formula IV may be 20 coupled with a compound of formula V (4-nitroimidazole) by methods known in the art to generate a compound of Formula IIb'. Suitable agents to be employed in the coupling of these compounds include the treatment of a compound of Formula IV with an organic or inorganic base, followed by reaction with the bromo compound of Formula IV. organic bases include trialkylamines, potassium hexamethyldisilazide, lithium hexamethyldisilazide, lithium diisopropylamide, potassium carbonate, and the like. Preferred for the practice of the present invention is sodium hydride or potassium carbonate in dimethylformamide.

A compound of Formula IIb' is then deprotected to provide a compound of Formula IIb, using lithium hydroxide,

15

25

30

this reduction reaction.

although other deprotecting reagents may be employed in this reaction. Such deprotecting agents include standard saponification reagents such as sodium hydroxide, potassium hydroxide, and lithium hydroxide.

Substantially pure (R) enantiomers of compounds of Formula IIb may also be synthesized by methods provided in U.S. 5,344,937 and 5,380,866, the disclosures of which are herein incorporated by reference.

A compound of Formula IIb is then converted to the corresponding amide under appropriate conditions with a compound of formula VI to generate a compound of Formula IIa. In general, amidation of primary or secondary amines of Formula VI may be accomplished by a number of methods known in the art in which activation of the acid to form a better leaving group. Suitable activating agents for this are also known in the art and include dicyclohexycarbodiimide (DCC), 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (EDC) with hydroxybenzotriazole (HOBT), oxalyl chloride, thionyl chloride, PyBOP® (benzotriazol-1-yloxytripyrrolidine-phosphonium hexafluorophosphate), and the like. Preferred for the practice of the present invention is hydroxybenzotriazole (HOBT). The nitro group on the resulting compound of Formula IIa may then be reduced to an amino group using any suitable means, employing a suitable reducing agent. Preferred for the practice of the present invention is a catalytic reduction employing hydrogen and 5%

The preferred reaction temperature range employed in these reactions is between -40 and 150 °C, and the most preferred range is between 10 and 40 °C. These reactions may be conveniently carried out in situ, without isolation of the particular compound after its preparation.

palladium on carbon. A compound of Formula II is produced by

Examples of these reactions are provided below in Scheme IB wherein R is representative of E as previously defined, and R_2R_1N is R_6 as previously defined.

A second portion of the overall synthesis of compounds of Formula I is provided in Scheme IC below.

-15-

Representative starting material for this synthesis is a compound of Formula IIIb', which is a chemically-protected form of the amino acid O-serine. By chemically-protected it is meant that both the amino- and carboxy- functional groups have been suitably protected in order to facilitate further reactions with this molecule. Such protection reactions are known to those of skill in the art, and may be applied to other suitable starting materials. Intermediates of formula IIIb' are commercially available, or may be prepared by standard syntheses of amino acids. Such syntheses are well 10 known to persons of ordinary skill in the art and are described, for example, in Chemistry and Biochemistry of Amino Acids, (G.C. Chapman ed., 1985). The protected amino group may be specifically deprotected using trifluoroacetic 15 acid and methylene chloride to allow for further reactions with this amino functional group. This deprotection reaction results in a compound of Formula IIIb.

A compound of Formula IIIb may then be N-acylated with an amino-protected compound of formula X to produce a 20 compound of Formula IIIa'. Suitable activating agents for this N-acylation reaction are known in the art and include DCC, HOBT, EDC, and oxalyl chloride. Preferred for the practice of the present invention is HOBT. Compounds of formula X are commercially available, or are readily prepared from suitable available starting materials. The 25 protected carboxy group on the compound of Formula IIIa' is then selectively deprotected, typically using lithium hydroxide, to generate a compound of Formula III. Compounds of Formula III in which the starting material IIIb' is 2-30 Nboc-amino-pentanoic acid methyl ester may also be prepared by the route described in Scheme IC.

A compound of Formula III is then coupled with a compound prepared from the reduction of IIb' with hydrogen and a palladium catalyst employing a coupling reaction to generate a compound of Formula Ia. Again, typical reagents for this N-acylation are known in the art, and include DCC

35

-16-

and HOBT, which is the preferred method of coupling employed in the practice of the present invention. A compound of Formula Ia is then selectively deprotected at the carboxy group, coupled at this site with a compound of Formula VI, and then further deprotected at the amino group to generate a compound of Formula Ia. Suitable agents for these deprotection and coupling reactions are discussed, infra, and are known in the art. Compounds of Formula Ia are encompassed by Formula I, and are pharmaceutically active.

The preferred reaction temperature range employed in these reactions is between -40 and 150 °C, and the most preferred range is between 10 and 40 °C. These reactions may be conveniently carried out *in situ*, without isolation of the particular compound after its preparation.

10

15

20

Alternatively, compounds of Formula IIa can be coupled with compounds of Formula III to provide intermediates which can be deprotected to give compounds of Formula Ia.

Representative reactions are provided below in Scheme IC, wherein R is E as previously defined, and R_2R_1N is R_6 as previously defined.

III

Ia

In addition to the synthetic scheme described hereinabove, an enantiospecific protocol for the preparation of the compounds of Formula I may be employed. Typically, a synthetic reaction design which maintains the chiral center present in the starting material in a desired orientation is chosen. The preferred reaction schemes are those that generally produce compounds in which greater than 95 percent of the product is the desired enantiomer. In Scheme II below, R-substituted phenyl is representative of the E substituents as provided in compounds of Formula I above.

Within Scheme II, a compound of Formula IV may be prepared by the alkylation of a compound of formula III by

25

30

standard methods using a base, such as sodium hydride, followed by treatment with an electrophile, such as methyl iodide. Preferred bases for this reaction include sodium, lithium, or potassium hexamethyldisilazide, lithium disopropylamide, and sodium hydride. Preferred methylating agents include methyl halides or any methyl group with a suitable substituted leaving group such as tosylate, mesylate, and the like.

A compound of Formula V may be prepared by hydrolysis

of a compound of Formula IV using standard saponfication
conditions known in the art. Suitable reagents for this
transformation include sodium hydroxide or lithium
hydroxide. The resulting carboxylic acid may be converted
into the acid chloride by standard methods using thionyl

chloride or, preferably, oxalyl chloride. The acid chloride
may then be reacted with the lithium salt of a chiral
auxiliary, such as (4R, 5S)-(+)-4-methyl-5-phenyl-2oxazolidinone, to provide compounds of formula V and VI,
which are readily separable by silica gel chromatography.

A compound of Formula VII may be prepared by the removal of the chiral auxiliary under basic conditions, such as lithium hydroxide. Other reagents known in the art for removing oxazolidinone-type chiral auxiliaries may be used for this transformation. These include lithium hydroxide/hydroperoxide conditions, reduction/oxidation protocols, alkyl sulfur displacements, and transaminations.

A compound of Formula VIII may be prepared from a compound of Formula VII by standard methods known in the art. Formation of the acid chloride using oxalyl or thionyl chloride followed by reaction with a suitable substituted amine (NR₂) provide compounds of Formula VIII.

A compound of Formula IX may be prepared by the reduction of a compound of Formula VIII using hydrogen with palladium on carbon. Other methods known in the art which

may be employed for the reduction of the nitro group include the use of tin(II)chloride, iron in an acidic solution, ferrous sulfate and aqueous alkali, activated alumina, and sodium sulfite. The resulting 4-amino imidazole compound of Formula VIIa is then reacted directly with the appropriate dipeptide acid (a compound of Formula IIX) under standard peptide coupling conditions involving formation of the active ester of the dipeptide followed by reaction with amine VIIa. Conditions suitable for amide formation include 10 DCC, EDC, with HOBT. A compound of Formula IIX may be prepared from the methyl ester of unnatural D-amino acids such as D-benzyloxyserine, D-tryptophan, and D-2-amino-5phenyl-pentanoic acid and the like which are known in the art. Standard coupling protocols involving formation of the 15 active ester of the amino acid using DCC/HOBT followed by reaction with N-Boc-aminoisobutyric acid provide dipeptide acids of Formula IIX.

The Boc protecting group of a compound of Formula IX may be removed under standard acidic conditions such as hydrochloric acid in acetic acid or ethyl acetate, trifluoroacetic acid, tetramethyliodosilane, aluminum chloride, sulfuric acid in dioxane, and methanesulfonic acid.

An additional method of preparing diastereomeric compounds of Formula I involves the use of a chromatographic column which employs a chiral phase. An example of such a preparation may be found in Examples Part 6 as provided hereinbelow.

Two additional Schemes for providing chiral

intermediates are provided hereinbelow as Schemes IIIA and
IIIB. As described in Scheme IIIA, optically pure aryl
glycine amino acids may be protected at the amino position
by reaction with a suitable protecting group, such as Boc.
Reaction of the Boc protected intermediate with a standard

methylating agent, such as methyl iodide, may provide the corresponding phenolic methyl ether. The carboxamide may be prepared by coupling with an amine, such as dimethylamine, pyrrolidine, or 4-methyl piperidine, using standard coupling techniques. Preferred coupling agents for the invention are 5 diethyl cyanophosphorane (DECP), triethylamine and the amine at O°C. The Boc protecting group may be removed under standard acidic conditions, with trifluoroacetic acid being preferred. The desired 4-nitroimidazole compounds can be prepared by reaction of the free amine with 1, 4-10 dinitroimidazole to give optically pure compounds, as determined by chiral HPLC. Such chiral intermediates can be processed as described in Schemes I and II to provide diastereomerically pure products. For example, the chiral nitroimidazoles described in Scheme IIIA or IIIB may be 15 reduced under standard conditions, such as hydrogenation with a palladium catalyst, to provide the corresponding chiral amino intermediate II. Such intermediates may be subsequently coupled with compounds of formula III of Scheme II as previously described to provide a chiral intermediate 20 which can be deprotected to give diastereomerically pure compounds of formula Ia.

10 Compounds of Formula I may be conveniently screened for growth hormone secretagogue activity. A typical assay may employ pituitary cells established in culture, followed by a challenge with the various compounds of formula I, and the levels of growth hormone determined accordingly. Growth 15 hormone levels may be calculated using various radioimmunoassay techniques known to those of skill in the art. Screening of compounds for growth hormone secretagogue activity may conveniently be scaled up for high throughput screening.

The invention further encompasses methods employing the pharmaceutically acceptable salts of the compounds defined by Formula I. Although generally neutral, a compound of this invention can possess a sufficiently acidic, a sufficiently basic, or both functional groups, and accordingly react with any of a number of inorganic bases, and inorganic and organic acids, to form a pharmaceutically acceptable salt.

The term "pharmaceutically acceptable salt" as used herein refers to salts of the compounds of Formula I which are substantially non-toxic to living organisms. Typical pharmaceutically acceptable salts include those salts prepared by reaction of the compounds of the present invention with a pharmaceutically acceptable mineral or organic acid or an inorganic base. Such salts are known as acid addition and base addition salts.

Acids commonly employed to form acid addition salts are inorganic acids such as hydrochloric acid, hydrobromic acid, hydroiodic acid, sulfuric acid, phosphoric acid, and the 20 like, and organic acids such as p-toluenesulfonic, methanesulfonic acid, oxalic acid, p-bromophenylsulfonic acid, carbonic acid, succinic acid, citric acid, benzoic acid, acetic acid, and the like. Examples of such pharmaceutically acceptable salts are the sulfate, 25 pyrosulfate, bisulfate, sulfite, bisulfite, phosphate, monohydrogenphosphate, dihydrogenphosphate, metaphosphate, pyrophosphate, chloride, bromide, iodide, acetate, propionate, decanoate, caprylate, acrylate, formate, isobutyrate, caproate, heptanoate, propiolate, oxalate, 30 malonate, succinate, suberate, sebacate, fumarate, maleate, butyne-1,4-dioate, hexyne-1,6-dioate, benzoate, chlorobenzoate, methylbenzoate, dinitrobenzoate, hydroxybenzoate, methoxybenzoate, phthalate, sulfonate, xylenesulfonate, phenylacetate, phenylpropionate, 35 phenylbutyrate, citrate, lactate, γ-hydroxybutyrate, glycolate, tartrate, methanesulfonate, propanesulfonate,

naphthalene-1-sulfonate, naphthalene-2-sulfonate, mandelate, mesylate, and the like. Preferred pharmaceutically acceptable acid addition salts are those formed with mineral acids such as hydrochloric acid and hydrobromic acid, and those formed with organic acids such as maleic acid and methanesulfonic acid.

Salts of amine groups may also comprise quaternary ammonium salts in which the amino nitrogen carries a suitable organic group such as an alkyl, alkenyl, alkynyl, or aralkyl moiety.

10

15

20

25

30

Base addition salts include those derived from inorganic bases, such as ammonium or alkali or alkaline earth metal hydroxides, carbonates, bicarbonates, and the like. Such bases useful in preparing the salts of this invention thus include sodium hydroxide, potassium hydroxide, ammonium hydroxide, potassium carbonate, sodium carbonate, sodium bicarbonate, potassium bicarbonate, calcium hydroxide, calcium carbonate, and the like. The potassium and sodium salt forms are particularly preferred.

It should be recognized that the particular counterion forming a part of any salt of this invention is not of a critical nature, so long as the salt as a whole is pharmacologically acceptable and as long as the counterion does not contribute undesired qualities to the salt as a whole.

This invention further encompasses methods employing pharmaceutically acceptable solvates of the compounds of Formula I. Many of the Formula I compounds can combine with solvents such as water, methanol, ethanol and acetonitrile to form pharmaceutically acceptable solvates such as the corresponding hydrate, methanolate, ethanolate and acetonitrilate.

This invention also encompasses methods employing the pharmaceutically acceptable prodrugs of the compounds of Formula I. A prodrug is a drug which has been chemically modified and may be biologically inactive at its site of

15

20

25

30

35

action, but which may be degraded or modified by one or more enzymatic or other in vivo processes to the parent bioactive form. This prodrug should have a different pharmacokinetic profile than the parent, enabling easier absorption across the mucosal epithelium, better salt formation or solubility, or improved systemic stability (an increase in plasma half-life, for example).

Typically, such chemical modifications include:

- ester or amide derivatives which may be cleaved by esterases or lipases;
- 2) peptides which may be recognized by specific or nonspecific proteases; or
- 3) derivatives that accumulate at a site of action through membrane selection of a prodrug form or a modified prodrug form; or any combination of 1 to 3, supra. Conventional procedures for the selection and preparation of suitable prodrug derivatives are described, for example, in H, Bundgaard, Design of Prodrugs, (1985).

As used herein, the term "effective amount" means an amount of compound of the instant invention which is capable of inhibiting, alleviating, ameliorating, treating, or preventing further symptoms in mammals, including humans, which may be due to decreased levels of endogenous growth hormone.

By "pharmaceutically acceptable formulation" it is meant that the carrier, diluent, excipients and salt must be compatible with the active ingredient (a compound of Formula I) of the formulation, and not be deleterious to the recipient thereof. Pharmaceutical formulations can be prepared by procedures known in the art. For example, the compounds of this invention can be formulated with common excipients, diluents, or carriers, and formed into tablets, capsules, and the like. Examples of excipients, diluents, and carriers that are suitable for such formulations include the following: fillers and extenders such as starch, sugars, mannitol, and silicic derivatives; binding agents

such as carboxymethyl cellulose and other cellulose derivatives, alginates, gelatin, and polyvinyl pyrrolidone; moisturizing agents such as glycerol; disintegrating agents such as agar agar, calcium carbonate, and sodium bicarbonate; agents for retarding dissolution such as paraffin; resorption accelerators such as quaternary ammonium compounds; surface active agents such as cetyl alcohol, glycerol monostearate; adsorptive carriers such as kaolin and bentonite; and lubricants such as talc, calcium and magnesium stearate and solid polyethylene glycols. Final pharmaceutical forms may be: pills, tablets, powders, lozenges, syrups, aerosols, sachets, cachets, elixirs, suspensions, emulsions, ointments, suppositories, sterile injectable solutions, or sterile packaged powders, and the 15 like, depending on the type of excipient used.

Additionally, the compounds of this invention are well suited to formulation as sustained release dosage forms. The formulations can also be so constituted that they release the active ingredient only or preferably in a particular part of the intestinal tract, possibly over a period of time. Such formulations would involve coatings, envelopes, or protective matrices which may be made from polymeric substances or waxes.

In addition, the growth hormone secretagogue compounds
as disclosed herein may be administered to a patient in need
of treatment in combination with other growth hormone
secretagogues known in the art, and/or with a suitable bone
anti-resorptive agent or agents for the prevention or
treatment of osteoporosis and/or loss of muscle strength.

Said suitable bone anti-resorptive agents include selective
estrogen receptor modulators, bisphophonates, calcitonin,
and hormone replacement therapeutic agents. Additionally,
PTH may be administered in combination with said growth
hormone secretagogues. Said combination therapy may be
administered concomitantly or sequentially.

The present invention also relates to methods for the modulation of cardiac function which comprise the administration of a compound of Formula I.

The present invention further relates to methods for the treatment or prevention of congestive heart failure by administering, to an animal in need thereof, an effective amount of a compound of Formula I.

The present invention additionally relates to pharmaceutical formulations containing a growth hormone secretagogue alone or in combination with additional therapeutic agents useful for the treatment or prevention of congestive heart failure.

The use of growth hormone secretagogue compounds, for the modulation of cardiac function and for the treatment or prevention of congestive heart failure, are described in copending U.S. Patent Application Serial No. 09/137,255, filed August 19, 1998, titled "Treatment of Congestive Heart Failure With Growth Hormone Secretagogues", the teachings of which are incorporated herein in their entirety by reference.

The particular dosage of a compound required to treat, inhibit, or prevent the symptoms and/or disease of congestive heart failure in a mammal, including humans, according to this invention will depend upon the particular disease, symptoms, and severity. Dosage, routes of administration, and frequency of dosing is best decided by the attending physician. Generally, accepted and effective doses will be from 15mg to 1000mg, and more typically from 15mg to 80mg. Such dosages will be administered to a patient in need of treatment from one to three times each day or as often as needed for efficacy.

Representative pharmaceutical formulations containing compounds of formula I are provided below. The formulations which follow are given for purposes of illustration and are

not intended to be limiting in any way. The total active ingredients in such formulations comprises from 0.1% to 99.9% by weight of the formulation. The term "active ingredient" means a compound of Formula I.

5

Formulation 1

Hard gelatin capsules containing the following ingredients are prepared:

10	Ingredient	(mg/capsule)
	Active Ingredient	30.0
	Starch	305.0
	Magnesium stearate	5.0

The above ingredients are mixed and filled into hard gelatin capsules in 340 mg quantities.

Formulation 2

A tablet formula is prepared using the ingredients 20 below:

	Ingredient	Quantity (mg/tablet)
	Active Ingredient	25.0
	Cellulose, microcrystalline	200.0
25	Colloidal silicon dioxide	10.0
	Stearic acid	5.0

The components are blended and compressed to form tablets, each weighing 240 mg.

30

Formulation 3

A dry powder inhaler formulation is prepared containing the following components:

	Ingredient		Weight %
35	Active Ingredient	•	5
	Lactose		95

The active mixture is mixed with the lactose and the mixture is added to a dry powder inhaling appliance.

Formulation 4

Tablets, each containing 30 mg of active ingredient, are prepared as follows:

	Ingredient	Quantity (mg/tablet)
	Active Ingredient	30.0 mg
10	Starch	45.0 mg
	Microcrystalline cellulose	35.0 mg
	Polyvinylpyrrolidone	
	(as 10% solution in water)	4.0 mg
	Sodium carboxymethyl starch	4.5 mg
15	Magnesium stearate	0.5 mg
	Talc	1.0 mg
	Total	120 mg

through a No. 20 mesh U.S. sieve and mixed thoroughly. The solution of polyvinylpyrrolidone is mixed with the resultant powders, which are then passed through a 16 mesh U.S. sieve. The granules so produced are dried at 50-60°C and passed through a 16 mesh U.S. sieve. The sodium carboxymethyl starch, magnesium stearate, and talc, previously passed through a No. 30 mesh U.S. sieve, are then added to the granules which, after mixing, are compressed on a tablet machine to yield tablets each weighing 120 mg.

Formulation 5

Capsules, each containing 40 mg of medicament are made as follows:

		Quantity
	Ingredient	(mg/capsule)
	Active Ingredient	40.0 mg
35	Starch	109.0 mg
	Magnesium stearate	1.0 mg
	Total	150.0 mg

The active ingredient, cellulose, starch, and magnesium stearate are blended, passed through a No. 20 mesh U.S. sieve, and filled into hard gelatin capsules in 150 mg quantities.

Formulation 6

Suppositories, each containing 25 mg of active ingredient are made as follows:

10	Ingredient	Amount
	Active Ingredient	25 mg
	Saturated fatty acid glycerides	2,000 mg

The active ingredient is passed through a No. 60 mesh
U.S. sieve and suspended in the saturated fatty acid
glycerides previously melted using the minimum heat
necessary. The mixture is then poured into a suppository
mold of nominal 2.0 g capacity and allowed to cool.

20 Formulation 7

Suspensions, each containing 50 mg of medicament per 5.0 ml dose are made as follows:

25	Ingredient		Amount
	Active Ingredient		50.0 mg
	Xanthan gum		4.0 mg
	Sodium carboxymethyl cellulose	(11%)	
	Microcrystalline cellulose	(89%)	50.0 mg
30	Sucrose		1.75 g
	Sodium benzoate		10.0 mg
	Flavor and Color		q.v.
	Purified water to		5.0 ml

The medicament, sucrose and xanthan gum are blended, passed through a No. 10 mesh U.S. sieve, and then mixed with

WO 00/49037 PCT/US00/04274

-34-

a previously made solution of the microcrystalline cellulose and sodium carboxymethyl cellulose in water. The sodium benzoate, flavor, and color are diluted with some of the water and added with stirring. Sufficient water is then added to produce the required volume.

Formulation 8

Capsules, each containing 15 mg of medicament, are made as follows:

10		Quantity
	Ingredient	(mg/capsule)
	Active Ingredient	15.0 mg
	Starch	407.0 mg
	Magnesium stearate	3.0 mg
15	Total	425.0 mg

The active ingredient, cellulose, starch, and magnesium stearate are blended, passed through a No. 20 mesh U.S. sieve, and filled into hard gelatin capsules in 425 mg quantities.

Formulation 9

An intravenous formulation may be prepared as follows:

	Ingredient	Quantity
25	Active Ingredient	250.0 mg
	Isotonic saline	1000 ml

20

35

Formulation 10

A topical formulation may be prepared as follows:

30	Ingredient	Quantity
	Active Ingredient	1-10 g
	Emulsifying Wax	30 g
	Liquid Paraffin	20 g
	White Soft Paraffin	to 100 g

The white soft paraffin is heated until molten. The liquid paraffin and emulsifying wax are incorporated and

stirred until dissolved. The active ingredient is added and stirring is continued until dispersed. The mixture is then cooled until solid.

Formulation 11

5

20

25

30

Sublingual or buccal tablets, each containing 10 mg of active ingredient, may be prepared as follows:

		Quantity
	Ingredient	Per Tablet
10	Active Ingredient	10.0 mg
	Glycerol	210.5 mg
	Water	143.0 mg
	Sodium Citrate	4.5 mg
	Polyvinyl Alcohol	26.5 mg
15	Polyvinylpyrrolidone	15.5 mg
	Total	410.0 mg

The glycerol, water, sodium citrate, polyvinyl alcohol, and polyvinylpyrrolidone are admixed together by continuous stirring and maintaining the temperature at about 90°C. When the polymers have gone into solution, the solution is cooled to about 50-55°C and the medicament is slowly admixed. The homogenous mixture is poured into forms made of an inert material to produce a drug-containing diffusion matrix having a thickness of about 2-4 mm. This diffusion matrix is then cut to form individual tablets having the appropriate size.

Another formulation employed in the methods of the present invention employs transdermal delivery devices or patches. Such transdermal patches may be used to provide continuous or discontinuous infusion of the compounds of the present invention in controlled amounts. The construction and use of transdermal patches for the delivery of pharmaceutical agents is well known in the art. See, for example, U.S. Patent 5,023,252, the disclosure of which is herein incorporated by reference. Such patches may be

WO 00/49037 PCT/US00/04274

10

constructed for continuous, pulsatile, or on demand delivery of pharmaceutical agents.

Frequently, it will be desirable or necessary to introduce the pharmaceutical composition to the brain, either directly or indirectly. Direct techniques usually involve placement of a drug delivery catheter into the host's ventricular system to bypass the blood-brain barrier. One such implantable delivery system, used for the transport of biological factors to specific anatomical regions of the body, is described in U.S. Patent 5,011,472, the disclosure of which is herein incorporated by reference.

Indirect techniques, which are generally preferred, usually involve formulating the compositions to provide for drug latentiation by the conversion of hydrophilic drugs into lipid-soluble drugs or prodrugs. Latentiation is generally achieved through blocking of the hydroxy, carbonyl, sulfate, and primary amine groups present on the drug to render the drug more lipid soluble and amenable to transportation across the blood-brain barrier.

20 Alternatively, the delivery of hydrophilic drugs may be enhanced by intra-arterial infusion of hypertonic solutions which can transiently open the blood-brain barrier.

The following Examples and Preparations are
illustrative of the processes employed in the synthesis of
the compounds of the present invention. As would be
understood by persons skilled in the art, other synthetic
schemes may be employed to prepare the compounds of the
instant invention.

Preparation 2A

A solution of sodium ethoxide was generated by the addition of sodium metal (52.89 grams, 2.3007 mol), over 3 hours, to ethanol (1500 mL). To the sodium ethoxide solution, at ambient temperature, was added a solution of diethylacetamidomalonate (499.75 grams, 2.3007 mol) dissolved in ethanol (225 mL). The reaction mixture was stirred for 1.5 hours at ambient temperature. 1-bromo-3phenylpropane (458.07 grams, 2.3007 mol) was then added over 15 minutes and the reaction mixture was refluxed until 10 complete as determined by HPLC (16 hours). The reaction mixture was concentrated to dryness and the residue partitioned between ethyl acetate (1 x 1500 mL and 2 x 500 mL) and water (1500 mL). The ethyl acetate layers were combined, washed with saturated sodium chloride solution (4 x 500 mL), dried using sodium sulfate, and concentrated to 15 give 752.1 grams (98%) of the above-identified product as a light yellow solid: A 1.0 gram sample was recrystallized from hexane:ethyl acetate (19:1, v:v) to give a mp 84-86°C. ¹H nmr (CDCl₃): δ 1.18-1.23 (t, 6H), 1.37-1.50 (m, 2H), 2.02 (s, 3H), 2.34-2.41 (m, 2H), 2.58-2.62 (t, 2H), 4.16-4.24 (q, 20 4H), 6.76 (s, broad, 1H), 7.11-7.28 (m, 5H). ¹³C nmr ($CDCl_3$): δ 13.95, 23.03, 25.67, 31.85, 35.45, 62.46, 66.49, 125.40, 125.90, 128.27, 128.35, 141.77, 168.11, 168.94. Preparation 3

To a slurry of sodium hydride (13.6 g of a 60% dispersion in mineral oil, 341 mmol) stirring in N,Ndimethylformamide (240 mL) was carefully added 4nitroimidazole (38.6 g, 341 mmol) such that the temperature during the addition was maintained below 40 °C. resulting slurry was stirred for 1 hour and then cooled to 5 °C. To this mixture was slowly added Preparation 3A (76 g, 310 mmol) at a rate such that the reaction temperature 10 was maintained below 20 °C. After 4 hours, the reaction was concentrated and subsequently extracted with ethyl acetate. The combined organic extracts were filtered, washed with water, brine, dried over sodium sulfate, filtered and 15 concentrated. The resulting residue was purified by silica gel chromatography (methanol/chloroform gradient) to yield the 60.1 g (70%) of the above-identified product as a white solid: ¹H-NMR is consistent with structure; MS (FD) 275 (M+); Anal. A solution of the product of Preparation 6A (8.35 g, 28.89 mmol) in THF (100 mL) was treated with lithium hydroxide (1.82 g, 43.34 mmol) and water (50 mL). The reaction was stirred at ambient temperature for 30 minutes. 10 Water was added and the mixture washed with diethyl ether. The pH of the aqueous layer was adjusted to 3.0 with 10% sodium bisulfate. The mixture was saturated with sodium chloride and washed with ethyl acetate. The ethyl acetate washes were combined, dried over sodium sulfate, filtered, 15 and concentrated in vacuo. The resulting crude solid was dissolved in anhydrous dichloromethane (100 mL) under nitrogen. To this solution was added catalytic DMF (0.1 mL) and excess oxalyl chloride (25 g). This mixture was stirred for 3 hours, then concentrated in vacuo. The resulting 20 crude foam was dissolved in THF (20 mL) and added dropwise to a solution of lithium (4R,5S)-(+)-4-methyl-5-phenyl-2oxazolidinone which was generated by adding n-BuLi (1.6M in hexanes, 19.9 mL, 31.82 mmol) dropwise to a solution of (4R, 5S)-(+)-4-methyl-5-phenyl-2-oxazolidinone (5.64 g, 31.82 25 mmol) in THF (50 mL) at -78 °C under nitrogen and stirred for 20 minutes; and then used without further purification.

The resulting mixture was stirred at -78 °C for 30 minutes, then warmed to 0 °C. The mixture was quenched with saturated sodium bicarbonate. Ethyl acetate and water were added and the mixture washed with sodium bicarbonate and 5 brine. The organic layer was dried over sodium sulfate, filtered, and concentrated in vacuo. The resulting foam was purified by flash chromatography (400 g silica, 5% diethyl ether/dichloromethane) to yield diastereomer 1 (3.76 g, 31% yield) and diastereomer 2 (4.32 g, 36%) of above-identified product as colorless foams:

Preparation 13A

A suspension of 2-naphthyl acetic acid (49.37 g, 265.0 mmol) and thionyl chloride (80 mL) in carbon tetrachloride (55 mL) was heated to reflux for 20 minutes at which time all material went into solution. The reaction was cooled to

ambient temperature. Carbon tetrachloride (125 mL), Nbromosuccinamide (56.60 g, 318.0 mmol), and hydrobromic acid (48% ag., catalytic, 0.5 mL) were added. The mixture was heated to reflux for 30 minutes, cooled to ambient temperature, filtered, and concentrated in vacuo. The material was redissolved in dichloromethane (200 mL) and excess ethanol (100 mL) was added dropwise. The mixture was stirred at ambient temperature for 1 hour, then concentrated in vacuo. The crude material was chromatographed (700 g silica, 30% ethyl acetate/hexane) to yield a crude tan 10 solid. This crude material was dissolved dimethylformamide (200 mL) and 4-nitroimidazole (29.78 g, 263.5 mmol) and potassium carbonate (72.70 g, 526.8 mmol) were added. The reaction was stirred at ambient temperature, then 15 concentrated in vacuo to 100 mL. Ethyl acetate and water were added and the mixture washed with sodium bicarbonate and brine. The organic layer was dried over sodium sulfate and concentrated in vacuo. The crude material was chromatographed (1.0 kg silica, 30% ethyl acetate/hexane) to yield the above-identified product (Preparation 13A) (40.2 20 g, 47%), as follows, as a brown foam: ¹H NMR (300 MHz, CDCl3) - consistent with structure; Anal. calc'd. for $C_{17}H_{15}N_{3}O_{4}$; 62.76 C, 4.65 H, 12.92 N; found 60.54 C, 4.35 H, 12.04 N; ISMS (M+) - 326.

N-Methyl morpholine (4.79 mL, 2 eq, 47.3 mm) was added to a stirred slurry of N-Boc-a-aminoisobutyric acid (4.43 g, 21.7 mm, 1 eq) and 3.89 g (21.7 mm, 1.0 eq) of 2-chloro-(4,6)-dimethoxy-1,3,5-triazine (CDMT) in 100 mL of diethyl ether. After stirring the reaction mixture at ambient temperature for 1.5 hours, D-tryptophan ester 10 hydrochloride was added. After stirring overnight, the reaction mixture was quenched by the addition of 150 mL of 10% aqueous citric acid solution. The layers were separated and the ether layer was washed with 50 mL of saturated sodium bicarbonate solution and 50 mL of 15 water. Lithium hydroxide (2.43 g, 5 eq) was dissolved in 100 ml of water and the solution was added to the diethyl ether solution and stirred vigorously for 4 hours at room temperature. The layers were separated and the pH of the aqueous layers was adjusted to 5.6 with 1M HCl. The pH 20 was then adjusted to 3.95 with 10% citric acid solution and the aqueous layer was extracted with 100 mL of ethyl acetate. The ethyl acetate layers were washed with brine, dried over magnesium sulfate and filtered. The volatiles were removed under vacuum to give 82 % yield of 25 the desired product as a white foam. 1H-NMR consistent with structure.

Preparation R1

Ethyl 2-(2-Naphthyl)acetate

A steady stream of anhydrous hydrochloric acid was bubbled subsurface into a solution of 2-naphthylacetic acid (251.38 grams, 1.35 mol) dissolved in ethanol (1760 mL) over a period of 10 minutes. The resulting solution was stirred at ambient temperature until complete as determined by hplc (2 hours). The reaction mixture was concentrated to 15 dryness. The resulting oil was dissolved in ethyl acetate (200 mL) and filtered through silica gel (300 grams) eluting the product with ethyl acetate (1400 mL). The filtrate was concentrated to give 286.33 grams (99%) of ethyl 2-(2naphthyl)acetate as a colorless oil. 25

Preparation EX1A

To a suspension of 5% Pd/C (0.85 g) and a compound of Preparation 3 (2.13 g, 7.21 mmol) stirring in dioxane (50 mL) at room temperature was added hydrogen (g) (35 psi) on a Parr apparatus. After 4 hours, the mixture was purged with nitrogen, celite added, and the solution filtered through a pad of celite. To the resulting filtrate, under nitrogen

	·	

atmosphere, was added a compound of Preparation 1 (2.74 g, 7.21 mmol), 1-hydroxybenzotriazole (0.97 g, 7.21 mmol), N,Ndiisopropylethylamine (2.5 mL, 14.4 mmol), and 1-(3dimethylaminopropyl)-3-ethylcarbodiimide (1.36 g, 7.93 mmol). After 18 hours, ethyl acetate was added and the mixture washed with saturated aqueous ammonium chloride, saturated aqueous sodium bicarbonate, and brine. The organic extract was dried over sodium sulfate and concentrated. Purification by silica gel chromatography (5% 10 methanol/dichloromethane) yielded the above-identified compound (1.25 g, 29 %) as a yellow foam: ¹H NMR (300 MHz, CDCl₃) d 1.30 (t, J = 6.9 Hz, 3H), 1.40 (s, 9H), 1.42 (s, 3H), 1.51 (s, 3H), 3.60 (dd, J = 5.1, 9.7 Hz, 1H), 4.05 (m, 1H), 4.28 (m, 2H), 4.54 (dd, J = 14.08, 26.3 Hz, 2H), 4.62(m, 1H), 5.08 (bs, 1H), 5.82 (s, 1H), 7.12 (d, J = 11.5 Hz, 15 1H), 7.35 (m, 12H), 9.75 (bs, 1H); MS (FD) m/e 607; Anal. calc'd for C₃₂H₄₁N₅O₇: C, 63.29; H, 6.80; N, 11.52. Preparation EX1B

To a solution of a compound of Preparation EX1A (5.3 g, 8.75), stirring in dioxane (50 mL)/water (25 mL) at room temperature, was added lithium hydroxide (0.73 g, 17.50 mmol). After 20 minutes, water was added and the reaction concentrated to approximately 30 mL. The resulting mixture was extracted with diethyl ether and the aqueous layer saturated with sodium chloride then adjusted to pH 3.5 with

1 N HCl. The mixture was extracted with ethyl acetate and the combined organic extracts dried over sodium sulfate and concentrated to yield the above-identified compound (4.90 g, 97%) as a light orange foam: ¹H NMR (300 MHz, CDCl₃) d; MS (FD) m/e; Anal. calc'd for: C,; H,; N, . Found: C,; H,; N,.

Preparation EX1C

Example 2-2 Preparation EX2A

isomer 1

5

A solution of the product of Preparation 6B, diastereomer 1 (2.30 g, 5.48 mmol) in THF (50 mL) was added to a solution of lithium hydroxide (0.25 g, 6.03 mmol) in water (25 mL). The resulting mixture was stirred at ambient temperature for 30 minutes. Water was added and the mixture 10 washed with diethyl ether. The pH of the aqueous layer was adjusted to 3.0 with 10% aqueous sodium bisulfate. The mixture was saturated with sodium chloride and washed with ethyl acetate. The ethyl acetate washes were combined, 15 dried over sodium sulfate, filtered, and concentrated in vacuo. The resulting crude solid was dissolved in anhydrous dichloromethane (50 mL) under nitrogen. To this solution was added catalytic DMF (0.1 mL) and excess oxalyl chloride (5 g). This mixture was stirred for 3 hours, then concentrated in vacuo. The resulting crude foam was dissolved in anhydrous dichloromethane (50 mL) and cooled to 0 °C. 4-Dimethylaminopyridine (catalytic, 10 mg) and pyrrolidine (1.8 mL, 18.74 mmol) were added and the resulting solution was stirred for 18 hours.

25 Dichloromethane was then added and the mixture washed with sodium bicarbonate and brine. The organic layer was dried

over sodium sulfate, filtered, and concentrated in vacuo. The crude foam was purified by flash chromatography (silica, 100 g, 5% methanol/dichloromethane) to yield the above-identified product (1.73 g, 88% yield) as a colorless foam: $^{1}\text{H NMR}$ (300 MHz, CDCl₃) - consistent with structure; Anal. calc'd. for C₁₆H₁₈N₄O₃; 61.14 C, 5.77 H, 17.82 N; found 60.67 C, 5.78 H, 16.03 N; FDMS (M+) - 314.

A solution of the product of Preparation EX2A (1.66 g, 5.29 mmol) in THF (5 mL) was added to a suspension of 5% palladium on carbon (0.80 g, catalytic, 25 mL THF) under inert atmosphere. The resulting mixture was placed under hydrogen (40 psi) on a Parr shaker for 1.5 hours. The resulting mixture was placed under nitrogen and celite added. The mixture was then filtered and rinsed with THF. The filtrate was place under nitrogen and HOBT (0.71 g, 5.29 mmol), the product of Preparation 1 (2.01 g, 5.29 mmol), EDC (1.00 g, 5.81 mmol), and DIEA (1.0 mL, 5.81 mmol) were added. The resulting mixture was stirred for 18 hours at ambient temperature, then concentrated in vacuo. The crude material was dissolved in ethyl acetate and washed with

sodium bicarbonate and brine. The organic layer was dried over sodium sulfate, filtered, and concentrated in vacuo. The resulting crude foam was purified by flash chromatography (silica, 100 g, 2% methanol/dichloromethane) to yield the above-identified product (0.66 g, 19% yield) as a light yellow foam: ¹H NMR (300 MHz, CDCl₃) - consistent with structure; Anal. calc'd. for C₃₅H₄₆N₆O₆; 65.00 C, 7.17 H, 12.99 N; found 63.21 C, 6.92 H, 12.54 N; FDMS (M+) - 646.

Compounds 7 and 8

To a solution of the product of Preparation EX4A (7.26 g, 10.5 mmol), stirring in dichloromethane (25 mL) at room temperature, was added trifluoroacetic acid (10 mL). After

10

4 hours, the reaction mixture was poured into a saturated solution of sodium bicarbonate extracted with chloroform. The combined organic extracts were washed with brine, dried over sodium sulfate, filtered and concentrated to yield 6.12 5 g (99%) of the free base as a tan foam. The diastereomeric material (3.0 g) was chromatographed on an 8 x 15 cm Prochrom column packed with Kromasil CHI-DMP chiral phase using an eluent mixture of 3A alcohol (13% by v), dimethylethylamine (0.2% by v) in heptane at a flow rate of 250 mL/min to provide the individual diastereomers in pure form:

Compound 7 Isomer: To a solution of the purified isomer in ethyl acetate was added a saturated solution of hydrochloric acid in diethyl ether. The resulting slurry 15 was concentrated to dryness to yield 1.1 g (37%) of the desired product as a white solid: 1H NMR (d, DMSO) 0.50 (d, J = 6.0 Hz, 1.5 H), 0.80 (d, J = 6.0 Hz, 1.5 H), 1.16 (m,1H), 1.35 (m, 1H), 1.50-1.70 (m, 8H), 2.60-2.70 (m, 2H), 3.03 (m, 1H), 3.65-3.80 (m, 6H), 4.40 (m, 1H), 4.53 (s, 2H), 4.75 (m, 1H), 6.90-7.08 (m, 3H), 7.25-7.45 (m, 9H), 8.20-8.40 (m, 4H), 8.61 (d, J = 7.5 Hz, 1H), 11.15 (br s, 1H); t_R = 7.93 min; MS (ion spray) 591.6 (M+1); Anal. using the product of Preparation 14 (1.32 g, 3.55 mmol) and 5% palladium on carbon (1.4 g, catalytic, 50 mL THF) to give the crude amine. The resulting filtrate was reacted with HOBT (0.48 g, 3.55 mmol), the product of Preparation 1 (1.35 g, 3.55 mmol), and DCC (0.81 g, 3.91 mmol) to yield the above-identified product (0.82 g, 33% yield), as follows, as a light yellow foam: ¹H NMR (300 MHz, CDCl₃) - consistent with the structure; Anal. calc'd. for C₃₈H₅₂N₆O₇; 64.75 C, 7.44 H, 11.92 N; found 66.19 C, 7.17 H, 12.10 N; ISMS (M+) - 705.

Compound 8

A solution of the product of Preparation EX5A (0.82g, 1.16 mmol), in dichloromethane (20 mL), was stirred under nitrogen with anisole (0.4 mL) and trifluoroacetic acid at ambient temperature for 3 hours. The mixture was quenched with saturated sodium bicarbonate and stirred for 10 minutes at ambient temperature. Dichloromethane was added and the 10 mixture was washed with bicarbonate and brine. The organic layer was dried over sodium sulfate, concentrated in vacuo, and redissolved in 2 mL ethyl acetate. Diethyl ether (saturated HC1(g), 5 mL) was added and the mixture was then stirred for 12 minutes. The mixture was filtered to yield 15 the above-identified product (0.71 g, 90%) as a pale yellow solid: ¹H NMR (300 MHz, CDCl₃) - consistent with structure; Anal. calc'd. for $C_{33}H_{46}N_6O_5Cl_2$; 58.49 C, 6.84 H, 12.40 N; found 55.40 C, 6.48 H, 11.80 N; ISMS (M+) - 605.

Example 2-9

Preparation EX6A

To a suspension of 5% palladium on carbon (1.75 g) and 5 tetrahydrofuran (120 mL) was added the product of Preparation 4 (3.51 g, 11.5 mmol). The reaction mixture was placed under a hydrogen atmosphere (40 mm Hg) on a Parr apparatus for 2 hours then filtered through celite. filtrate was subsequently added to a solution of the product 10 of Preparation 2 (4.33 g, 11.5 mmol), 1-(3dimethylaminopropyl)-3-ethylcarbodiimide (2.60 g, 12.6 mmol) and 1-hydroxybenzotriazole (1.72 g, 12.6 mmol) stirring in tetrahydrofuran (50 mL) at 0 °C. After 16 hours at room 15 temperature, the reaction mixture was concentrated. resulting residue was dissolved in ethyl acetate, filtered and the resulting filtrate concentrated. The crude residue was purified by flash chromatography (silica gel, 90 % ethyl acetate/hexanes to 10 % methanol/ethyl acetate gradient) to give 4.5 g (62 %) the desired product (Preparation EX6A), as 20 follows, as a light orange foam: 1H NMR consistent with structure; MS (IS) m/e 636 (M + 1). Anal. (C₃₄H₄₅N₅O₇) C, H, N.

Preparation EX6B

To a solution of the product of Preparation EX6A g, 1.59 mmol), stirring in tetrahydrofuran (30 mL) and water (15 mL) at room temperature, was added lithium hydroxide (0.26 g, 6.30 mmol). After 25 minutes, the reaction mixture was concentrated and the resulting residue was diluted with water and extracted with diethyl ether. The aqueous 10 extracts were acidified to pH 2-3 with 1N hydrochloric acid and then extracted with ethyl acetate. The combined organic extracts were washed with brine, dried with sodium sulfate and concentrated to provide 0.96 g (99 %) of the desired compound (Preparation EX6B), as follows, as a light tan foam 15 that was used without further purification: 1H NMR consistent with structure; MS (IS) m/e 608 (M + 1). $(C_{32}H_{41}N_5O_7)$ C: calc'd, 63.25; found, 62.68, H, N.

Preparation EX6C

To a solution of the product of Preparation EX6B (0.93 g, 1.53 mmol), stirring in dichloromethane (25 mL) at room 5 temperature, was added N-methylmorpholine (0.20 mL, 1.83 mmol) and 2-chloro-(4,6)-dimethoxy-1,3,5-triazine (0.35 g, 1.99 mmol). After 1 hour, 4-methylpiperidine (0.20 mL, 1.68 mmol) was added and the resulting mixture was stirred room temperature for 2 hours at which time 2-chloro-(4,6)-10 dimethoxy-1,3,5-triazine (0.10 g, 0.70 mmol) was added. After 1 hour, the reaction mixture was concentrated and the resulting residue purified by flash chromatography (silica gel, ethyl acetate/methanol gradient) to give the desired compound (Preparation EX6C), as follows, as a light yellow 15 solid foam (0.875 g, 83%): ¹H NMR consistent with structure; MS (IS) m/e 689 (M + 1).Anal.($C_{38}H_{52}N_6O_6$) C,H,N.

Compound 10

To a solution of the product of Preparation EX6C (0.77 g, 1.12 mmol) and anisole (0.13 mL, 1.13 mmol) stirring in dichloromethane (20 mL) at 0 °C, was added trifluoroacetic acid. After 3-4 hours, the reaction mixture was warmed to room temperature and then quenched by pouring over cold saturated aqueous sodium bicarbonate. The organic layer was 10 collected and the aqueous layer was extracted twice with dichloromethane. The combined organic extracts were washed with aqueous sodium bicarbonate, water, brine, then dried over sodium sulfate and concentrated. The resulting material was purified by flash chromatography (silica gel, 15 5% methanol/ 95% ethyl acetate gradient to 5% triethylamine/10% methanol/ 85% ethyl acetate) to provide 0.63 g (95 %) of the desired mixture of diastereomers as an off-white solid foam. The mixture (190 mg) was resolved by chiral HPLC [Kromasil packing material, 15% 3A alcohol/ 85% heptane (w/ 0.2% dimethylamine)] to provide the two desired 20 diastereomers. To a solution of diastereomer 2 (65 mg) (retention time = 9.00 min) stirring in ethyl acetate (5 mL) was added saturated solution of hydrochloric acid in diethyl ether. The resulting white precipitate was collected by 25 vacuum filtration and rinsed with diethyl ether to provide

the desired compound (60 mg) as a white amorphous solid: 1H

Preparation EX9B

The product of Preparation EX9A (1.13 g, 3.42 mmol) was added to a mixture of 10% palladium/carbon (0.65 g) and palladium/black (0.15 g) in tetrahydrofuran (40 mL). The

mixture was shaken under hydrogen (38 psi) in a Parr apparatus. After reduction was complete, the reaction mixture was filtered through celite and then filtrate immediately combined with 1,3-dicyclohexylcarbodiimide (0.71 g, 3.45mmol), 1-hydroxybenzotriazole (0.46 g, 3.40 mmol), 5 the product of Preparation 2 (1.30 g, 3.44 mmol) and additional tetrahydrofuran (60 mL). After stirring overnight at ambient temperature, the mixture was concentrated and the residue slurried in ethyl acetate then 10 filtered. The filtrate was concentrated and the residue purified by flash chromatography (silica gel, chloroform/methanol) which afforded 1.50g (66%) of the desired product (Preparation EX9B), as follows, which was used without further purification.

Compound 15

A solution of the product of Preparation EX10B (0.69 g, 1.02 mmol) in dichloromethane (10 mL) was stirred under 5 nitrogen with anisole (0.2 mL) and trifluoroacetic acid (4.0 mL) at ambient temperature for 3 hours. The mixture was quenched with saturated sodium bicarbonate and stirred 10 minutes at ambient temperature. Dichloromethane was added and the mixture was washed with bicarbonate and brine. 10 organic layer was dried over sodium sulfate, concentrated in vacuo, and redissolved in 2 mL ethyl acetate. Diethyl ether (saturated HCl (g), 5 mL) was added and the mixture stirred 10 minutes. The mixture was filtered to yield the desired product (Example 10) (0.57 g, 86% yield) as a white solid: ¹H NMR (300 MHz, CDCl₃) - consistent with structure; Anal. calc'd. for $C_{32}H_{42}N_6O_4Cl_2$; 59.35 C, 6.85 H, 12.98 N; found 58.74 C, 6.77 H, 12.85 N; ISMS (M+) - 575.

Example 2-14 Preparation 473

To a solution of the product of Preparation 5 (3.60 g, 5.90 mmol) in anhydrous dichloromethane (60 mL) at 0°C was added N-methylmorpholine (0.78 mL, 7.08 mmol) and 2-chloro-4,6-dimethoxy-1,3,5-triazine (1.35 g; 7.67 mmol). mixture stirred for 1 h, warming to room temperature, at which time a 2M solution of N,N-dimethylamine (3.30 mL, 6.49 mmol) was added. The reaction stirred for 2 h at room 10 temperature, then more 2-chloro-4,6-dimethoxy-1,3,5-triazine (0.30 g) was added. The reaction was stirred for another 1 h and the solvent was evaporated under reduced pressure. The residue was dissolved in ethyl acetate, the solids were 15 filtered away and the filtrate was purified by flash chromatography (silica gel, ethyl acetate - 10% methanol/ethyl acetate) to give the desired product as a light yellow solid foam (2.93 g, 78%): 1H NMR consistent with structure; MS (IS) m/e 637 (M + 1); Anal. Calc'd for 20 C₃₃H₄₄N₆O₇: C, 62.25; H, 6.97; N, 13.20. Found: C, 61.02; H, 6.67; N, 13.72.

Compound 16

To a stirring solution of the product of Preparation 473 (3.60 g, 5.65 mmol) and anisole (0.65 mL, 5.93 mmol) in anhydrous dichloromethane (130 mL) at 0 $^{\circ}$ C was added trifluoroacetic acid (13 mL) via syringe. The reaction was stirred for 4 hours warming to room temperature and then was quenched by pouring over ice-cooled saturated sodium bicarbonate. The organic layer was collected and the 10 aqueous layer was extracted twice with dichloromethane. combined organic layers were washed with sodium bicarbonate, water and brine, then dried (sodium sulfate) and evaporated in vacuo to give an light yellow solid foam. The impure foam was purified by flash chromatography (silica gel, 5% 15 methanol/ethyl acetate - 5% triethylamine/10% methanol/ethyl acetate) to provide the desired product as an off-white solid foam (2.20 g, 73%). H NMR consistent with structure; MS (IS) m/e 537 (M + 1); Anal. Calc'd for $C_{28}H_{36}N_6O_5$: C, 62.67; H, 6.76; N, 15.66. Found: C, 62.53; H, 6.62; N, 20 15.57.

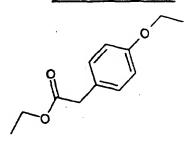

Diastereomeric separation: the product was resolved by HPLC [Kromasil packing material, 15% 3A alcohol/ 85% heptane (w/ 0.2% DMEA)] to provide two diastereomers. The second diastereomer (0.45 g) (retention time = 10.70 min) was

dissolved in ethyl acetate (10 mL) and then a saturated solution of hydrochloric acid in diethyl ether (2 mL) was added, with stirring. The white precipitate was collected by vacuum filtration and rinsed with diethyl ether. Vacuum drying provided Example 254 (0.40 g) as a white amorphous solid: ^{1}H NMR consistent with structure; MS (IS) m/e 537 (M + 1); Anal. Preparation 77

To a solution of the product of Preparation 76 (53 g, 255 mmol), stirring in carbon tetrachloride (600 mL) at room temperature, was added 46.6 g (262 mmol) of N-bromosuccinimide and 3.0 g (18.3 mmol) of 2,2'-azobis(2-methylpropionitrile). The resulting reaction mixture was heated to reflux. After 3.5 h, the solution was cooled to room temperature, filtered and concentrated. The resulting oil was chromatographed on silica gel using chloroform as eluant to afford 70.9 g (97%) of the desired product as a colorless oil: ¹H-NMR (d, DMSO) 1.17 (t, J = 7.2 Hz, 3H), 1.25-1.35 (m, 3H), 4.00-4.10 (m, 2H), 4.13-4.25 (m, 2H), 5.86 (s, 1H), 6.92 (d, J = 8.7 Hz, 2H), 7.47 (d, J = 9.0 Hz, 2H); MS (FD) 287, 289 (M+).

Preparation 78

Reaction of the product of Preparation 77 (11.4 g, 40 mmol), 4-nitroimidazole (4.5 g, 40 mmol) and potassium carbonate (16.6 g, 120 mmol) in dimethylformamide (100 mL) as described in Preparation 4 gave 5.47 g (43%) of the

desired product as a yellow oil: ^{1}H -NMR (d, DMSO) 1.18 (t, J = 7.2 Hz, 3H), 1.29 (t, J = 7.2 Hz, 3H), 4.03 (q, J = 7.2 Hz, 2H), 4.23 (q, J = 7.2 Hz, 2H), 6.54 (s, 1H), 6.70 (d, J = 8.7 Hz, 2H), 7.42 (d, J = 8.7 Hz, 2H), 7.90 (s, 1H), 8.34 (s, 1H); MS (ion spray) 320.2 (M+1); Anal. Example 2-20

Preparation 37

10 A mixture of the product of Preparation 8 (11.1 g, 32.3 mmol) and 5% palladium on carbon (1.7 g) in tetrahydrofuran (100 mL) was hydrogenated at 60 psi at room temperature using a Parr apparatus. After 1.5 hours, the resulting brown solution was filtered through celite and concentrated 15 to give 8.8 g (87%) crude oil which was used without purification. To a mixture of the amine stirring at 0 °C in tetrahydrofuran (20 mL) was added the product of Preparation 2 (10.6 g, 28.1 mmol) in tetrahydrofuran (30 mL). To this mixture was added 1-hydroxy-7-azobenzotriazole (4.0 g, 29.5 mmol) and 1,3-dicyclohexylcarbodiimide (6.1 g, 29.5 mmol). 20 The solution was allowed to warm to room temperature and the resulting mixture filtered after 3 days. The filtrate was concentrated and subsequently purified by flash chromatography (silica gel, 3.5% methanol/dichloromethane) 25 to provide 12.1 g (64%) of the desired product as an orange

solid: ${}^{1}H-NMR$ (d, DMSO) 1.15 (t, J = 7 Hz, 3H), 1.18-1.32 (m, 15H), 1.35-1.70 (m, 4H), 3.23 (m, 2H), 4.19 (q, J = 7 Hz, 2H), 4.31 (m, 1H), 6.58 (s, 1H), 7.00 (br s, 1H), 7.05-7.22 (m, 6H), 7.41 (m, 1H), 7.52-7.58 (m, 3H), 7.75 (d, J = 8 Hz, 2H), 10.19 (br s, 1H); MS (ion spray) 674.7 (M+1); Anal. Preparation 39

To a solution of the product of Preparation 38 (6.0 g, 9.3 mmol)stirring at 0°C in dimethylformamide was added dimethylamine hydrochloride (0.76 g, 9.3 mmol), diethylcyanophosphonate (1.41 mL, 9.3 mmol), and triethylamine (1.29 mL, 9.3 mmol). After 30 min, a second equivalent of dimethylamine hydrochloride, DECP and 10 triethylamine were added. After 30 min, the reaction mixture was diluted with ethyl acetate (300 mL) and washed with aqueous sodium bisulfate and brine. The organic extract was dried over sodium sulfate, filtered, and concentrated. The resulting crude material was purified by radial 15 chromatography (silica gel, 4% methanol in dichloromethane) to give 4.7 g (75%) of the desired product as a tan foam: 1 H-NMR (d, CDCl₃) 1.25(s, 9H), 1.42(s, 6H), 1.60-1.80 (m, 4H), 1.90 (br s, 1H), 2.57 (m, 2H), 2.98 (s, 6H), 4.48 (m, 1H), 7.05-7.21 (m, 6H), 7.50(m, 1H), 7.62-7.76 (m, 5H), 8.9320 (br s, 1H), 10.93 (br s, 1H); MS (ion spray) 673.7 (M+1).

Compounds 26 and 27

To the product of Preparation 39 (4.7 g, 7.0 mmol) was stirred at room temperature in a saturated solution of 5 hydrochloric acid in glacial acetic acid (30 mL). After 90 min, the mixture was concentrated. The resulting material diluted with ethyl acetate and extracted with aqueous sodium bicarbonate. The organic extract was dried over sodium sulfate, filtered, and concentrated to give 3.7 g (93%) of an orange solid. MS (ion spray) 573.4 (M+1). The 10 diastereomers (3.4 g) were separated by chiral chromatography using a Kromasil-CHI normal phase column to provide 1.40 q (41%) of isomer 1 and 1.26 g (37%) of isomer 2. The individual isomers were dissolved in a saturated solution of hydrochloric acid in glacial acetic acid (4 mL) 15 and subsequently concentrated to provide the desired products as tan solids:

Compound 41

Prepared as in Example 2-13 using the product of

Preparation EX17B (0.76 g, 1.05 mmol), trifluoroacetic acid
(2.0 mL), anisole (0.2 mL), and dichloromethane (8.0 mL) to
yield the desired product (Example 17) (0.76 g, 85% yield)
as an off white solid: ¹H NMR (300 MHz, CDCl₃) - consistent
with structure; Anal. calc'd. for C₄₀H₄₄N₆O₈F₆; 56.47 C, 5.21

H, 9.88 N; found 56.24 C, 5.32 H, 9.86 N; ISMS (M+) - 623.

Example 2-30

Preparation EX18A

Prepared as in Preparation EX2B using the product of
Preparation EX17A (0.60 g, 1.54 mmol) and 5% palladium on
carbon (0.60 g, catalytic, 25 mL THF) to give the crude
amine. The resulting filtrate was reacted with HOBT (0.21
g, 1.54 mmol), the product of Preparation 2 (0.58 g, 1.54
mmol), and DCC (0.35 g, 1.69 mmol) to yield the desired
product (Preparation EX18A), as follows, (0.56 g, 50% yield)
as a light yellow foam: ¹H NMR (300 MHz, CDCl₃) consistent with structure; Anal. calc'd. for C₄₂H₅₂N₆O₅; 69.98
C, 7.27 H, 11.66 N; found 68.71 C, 6.92 H, 11.39 N; ISMS
(M+) - 721.

Compound 42

Prepared as in Example 2-13 using the product of Preparation EX18A (0.52 g, 0.72 mmol), trifluoroacetic acid (4.0 mL), anisole (0.4 mL), and dichloromethane (20 mL) to yield the desired product (Example 18) (0.47 g, 94%) as a pale yellow solid: ¹H NMR (300 MHz, CDCl₃) - consistent with structure; Anal. calc'd. for C₃₇H₄₆N₆O₃Cl₂; 64.06 C, 6.68 H, 12.11 N; found 62.18 C, 6.59 H, 11.78 N; ISMS (M+) - 621.

Example 2-31

Preparation 470

To a suspension of 5% palladium on carbon (2.60 g) and 5 tetrahydrofuran (100 mL), in a Parr reaction bottle, was added the product of Preparation 11 (5.00 g, 15.3 mmol) as a The reaction bottle was placed on a Parr shaker, and shaken at room temperature for 2 h under a hydrogen atmosphere (40 psi). The reaction was filtered through a 10 pad of Celite 521 and the filtrate was then added to a previously prepared mixture of the product of Preparation 2 (5.80 g, 15.3 mmol), 1,3-dicyclohexylcarbodiimide (3.48 g. 16.9 mmol) and 1-hydroxybenzotriazole hydrate (2.29 g, 16.9 mmol) in 50 mL tetrahydrofuran at 0°C. The reaction was 15 stirred for 16 h at room temperature, then the solvent was evaporated under reduced pressure. The residue was dissolved in ethyl acetate and the 1,3-dicyclohexylurea was filtered away. The filtrate was purified by flash chromatography (silica gel, 80% ethyl acetate/hexanes - 5% 20 methanol/ethyl acetate) to give the desired product as a light yellow solid foam (7.96 g, 80%): ¹H NMR consistent with structure; MS (IS) m/e 682 (M + 1); Anal. Calc'd for $C_{39}H_{47}N_5O_6$: C, 68.70; H, 6.95; N, 10.27. Found: C, 68.27; H, 6.86; N, 10.77.

Preparation 471

To a solution of the product of Preparation 470 (8.73 g, 13.3 mmol) in tetrahydrofuran (120 mL) and water (60 mL) at room temperature was added lithium hydroxide (2.23 g. 53.2 mmol). The reaction stirred 35 min at room temperature, at which time the tetrahydrofuran was evaporated under reduced pressure. The residue was diluted with water and extracted with diethyl ether (the ether 10 extracts were discarded). The aqueous layer was acidified (pH 2-3) with 1N HCl and then extracted with diethyl ether and ethyl acetate. The combined organic layers were washed with brine, dried (sodium sulfate) and concentrated under reduced pressure to provide the desired product as a light 15 yellow solid foam that was used without further purification (8.18 g, 98%): ¹H NMR consistent with structure; MS (IS) m/e 654 (M + 1); Anal. Calc'd for $C_{37}H_{43}N_5O_6$: C, 67.98; H, 6.63; N, 10.71. Found: C, 66.83; H, 6.59; N, 10.50.

Preparation 472

To a solution of the product of Preparation 471 (1.00 g, 1.52 mmol) in anhydrous dichloromethane (30 mL) at 0°C 5 was added N-methylmorpholine (0.20 mL, 1.82 mmol) and 2chloro-4,6-dimethoxy-1,3,5-triazine (0.35 g, 1.98 mmol). This mixture stirred for 1 h, warming to room temperature, at which time a 2M solution of N,N-dimethylamine (0.84 mL, 1.68 mmol) was added. The reaction stirred for 2 h at room 10 temperature, then more 2-chloro-4,6-dimethoxy-1,3,5-triazine (0.08 g) was added. The reaction was stirred for another 1 h and the solvent was evaporated under reduced pressure. The residue was dissolved in ethyl acetate, the solids were filtered away and the filtrate was purified by flash 15 chromatography (silica gel, 90% ethyl acetate/hexanes - 10% methanol/ethyl acetate) to give the desired product as a light yellow solid foam (0.83 g, 80%): ¹H NMR consistent with structure; MS (IS) m/e 681 (M + 1); Anal. Calc'd for $C_{39}H_{48}N_6O_5$: C, 68.80; H, 7.11; N, 12.34. Found: C, 68.23; H, 20 7.03; N, 12.66.

Compound 43

To a stirring solution of the product of Preparation 472 (3.10 g, 4.52 mmol) and anisole (0.52 mL, 4.75 mmol) in anhydrous dichloromethane (100 mL) at 0°C was added trifluoroacetic acid (10 mL) via syringe. The reaction was stirred for 4 h warming to room temperature and then was quenched by pouring over ice-cooled saturated sodium bicarbonate. The organic layer was collected and the 10 aqueous layer was extracted twice with dichloromethane. combined organic layers were washed with sodium bicarbonate, water and brine, then dried (sodium sulfate) and evaporated in vacuo to give an light yellow solid foam. The impure foam was purified by flash chromatography (silica gel, 5% methanol/ethyl acetate - 5% triethylamine/10% methanol/ethyl 15 acetate) to provide the desired product as an off-white solid foam (2.40 g, 91%). H NMR consistent with structure; MS (IS) m/e 581 (M + 1); Anal. Calc'd for $C_{34}H_{40}N_6O_3$: C, 70.32; H, 6.94; N, 14.47. Found: C, 69.36; H, 6.71; N, 20 14.10.

Diastereomeric separation: the desired product was resolved by HPLC [Kromasil packing material, 15% 3A alcohol/ 85% heptane (w/ 0.2% DMEA)] to provide two diastereomers. The second diastereomer (0.76 g) (retention time = 9.98 min) was dissolved in ethyl acetate (15 mL) and then a saturated solution of hydrochloric acid in diethyl ether (2 mL) was added, with stirring. The white precipitate was collected by vacuum filtration and rinsed with diethyl ether. Vacuum drying provided Example 253 (0.70 g) as a white amorphous solid: 1 H NMR consistent with structure; MS (IS) m/e 581 (M + 1); Anal. A solution of lithium hydroxide (0.38 g, 9.16 mmol) in water (50 mL) was added to a solution of the product of Preparation 137 (6.04 g, 9.16 mmol) in tetrahydrofuran (100 mL). After 30 min, water was added and the mixture washed 10 with diethyl ether. The aqueous layer was adjusted to pH = 3.0 with sodium bisulfate, saturated with sodium chloride, and washed with ethyl acetate. The combined organic extracts were dried over sodium sulfate, and concentrated. To the resulting crude material stirring at room temperature 15 in dimethylformamide (50 mL) was added 1-(3dimethylaminopropyl)-3-ethylcarbodiimide (2.08 g, 10.01 mmol), 1-hydroxybenzotriazole (1.24 g, 9.16 mmol) and 4methylpiperidine (1.1 mL, 9.16 mmol). After 18 h, the 20 reaction was quenched with saturated bicarbonate, and washed with ethyl acetate. The combined organic extracts were washed with brine, dried over sodium sulfate, and concentrated. The crude material was purified by flash chromatography (silica gel, 5% methanol/dichloromethane) to yield 4.9 g (75 %) of the desired product as a pale yellow

To a solution of the product of Preparation 138 (4.90 g, 6.89 mmol) stirring at room temperature in dichloromethane (40 mL) and anisole (1.0 mL) was added to trifluoroacetic acid (10 mL). After 3 hours, the reaction 10 was quenched with saturated sodium bicarbonate and extracted with ethyl acetate. The combined organic extracts were washed with brine, dried over sodium sulfate and concentrated. The resulting crude material was purified by 15 flash chromatography (silica gel, 5% methanol/dichloromethane) to give the product as a mixture of diastereomers. This material was resolved by HPLC (Kromsil CHI-DMP chiral stationary phase, 3A alcohol/ dimethylethylamine/heptane eluant) to provide the free amine 20 of the desired products. The individual diastereomers were dissolved in ethyl acetate and treated with a saturated solution of hydrochloric acid in diethyl ether. The resulting precipitate was filtered to yield the desired products (426779 - 0.64 g, 14%) (426780 - 0.43 g, 9%) as tan 25 solids:

Example 2-42

Preparation 37

N-Methyl morpholine (4.79 mL, 2 eq, 47.3 mm) was added to a stirred slurry of N-Boc-a-aminoisobutyric acid (4.43 g, 21.7 mm, 1 eq) and 3.89 g (21.7 mm, 1.0 eq) of 2-chloro-(4,6)-dimethoxy-1,3,5-triazine (CDMT) in 100 mL of diethyl After stirring the reaction mixture at ambient temperature for 1.5 hours, D-tryptophan ester hydrochloride was added. After stirring overnight, the reaction mixture was quenched by the addition of 150 mL of 10% aqueous citric acid solution. The layers were separated and the ether layer was washed with 50 mL of saturated sodium bicarbonate solution and 50 mL of water. Lithium hydroxide (2.43 g, 5 eq) was dissolved in 100 ml of water and the solution was added to the diethyl ether solution and stirred vigorously for 4 hours at room temperature. The layers were separated and the pH of the aqueous layers was adjusted to 5.6 with 1M HCl. The pH was then adjusted to 3.95 with 10% citric acid solution and the aqueous layer was extracted with 100 mL of ethyl acetate. The ethyl acetate layers were washed with brine, dried over magnesium sulfate and filtered. volatiles were removed under vacuum to give 82 % yield of the desired product as a white foam. 1H-NMR consistent with structure.

The product of Preparation EX9A (0.85 g, 2.57 mmol) was combined with 10% palladium/carbon (0.50 g) and palladium/black (0.15 g) in tetrahydrofuran (40 mL) and the mixture shaken under a hydrogen atmosphere (38 psi) in a Parr apparatus. After reduction was complete, the catalyst was removed by filtration through celite and the amine/tetrahydrofuran solution was immediately combined with 1,3-dicyclohexylcarbodiimide (0.53 g, 2.57mmol), 1hydroxybenzotriazole (0.35 g, 2.57 mmol), the product of Preparation 1L (1.00 g, 2.57 mmol) and additional tetrahydrofuran (60 mL). After stirring overnight at ambient temperature, the mixture was concentrated and the residue slurried in ethyl acetate and filtered. The filtrate was concentrated and the residue purified by flash chromatography(silica gel, chloroform/methanol) which gave 1.62 g of the desired product which was used without further purification.

Compound 58

The compound of Preparation 15 (1.57 g, 2.34 mmol) was dissolved in dichloromethane (25 mL) and triflouroacetic acid (10 mL) added. The resulting mixture was stirred at ambient temperature for 2.5 h, concentrated, and the residue treated with excess aqueous sodium bicarbonate. The aqueous mixture was extracted with ethyl acetate and the combined organic extracts concentrated and dried. The residue was chromatographed over silica gel (chloroform/methanol) to provide 0.71 g. Example 2-46

Preparation 345

To a mixture of the product of Preparation 11 (6.0 g, 17.1 mmol) and 10% palladium on carbon (6.0 g) in tetrahydrofuran (100 mL). The reaction mixture was placed under a hydrogen atmosphere (40 psi) using a Parr

apparatus for 30 min then filtered through Celite. The resulting solution was then added to a previously prepared mixture of the product of Preparation 1L (6.66 g, 17.1 mmol), 1-hydroxybenzotriazole (2.31 g, 17.1 mmol), and 1,3 dicyclohexylcarbodiimide (3.53 g, 17.1 mmol) in tetrahydrofuran (75 mL). After 16 h at room temperature, the reaction mixture was concentrated and the crude material purified by flash chromatography (silica gel, 4% methanol/dichloromethane) to yield 6.17 g (52%) of the desired product as a brown foam: ¹H NMR consistent with structure; MS (ion spray) 693 (M+1).

Preparation 346

To a solution of the product Preparation 345 (4.6 g, 6.64 mmol) stirring in tetrahydrofuran (100 mL) at room temperature was added a solution of lithium hydroxide in water (40 mL of lM). After 30 min, the reaction mixture was acidified with 5N HCl (8.5 mL). The resulting mixture diluted with water and extraced with ethyl acetate. The combined organic extracts were dried over sodium sulfate and concentrated to yield 4.4 g (99%) of the desired product as a yellow foam.

Preparation 347

To a solution of the product Preparation 346 (4.0 g, 6.02 mmol) stirring in tetrahydrofuran (50 mL) at room temperature was added 1-hydroxybenzotriazole (813 mg, 6.02 mmol) and 1,3 dicyclohexylcarbodiimide (1.24 g, 6.02 mmol). After 15 min, dimethylamine (3.0 mL of a 2M soln in tetrahydrofuran, 6.02 mmol) was added. After stirring for 16 h in a sealed flask, the reaction mixture was filtered and concentrated. The resulting crude material was purified by flash chromatography (silica gel, 5% methanol/dichloromethane) to yield 2.79 g (68%) of the desired product as a yellow foam..

To the product of Preparation 347 (3.4 g, 5.0 mmol) was added a saturated solution of HCl(g)/acetic acid (50 mL). After 1.5 h, the reaction mixture was concentrated then partitioned between ethyl acetate and saturated sodium bicarbonate. The organic layer was removed, dried over sodium sulfate and concentrated to yield 2.45 g (84%) of the free base as a light yellow foam. diastereomeric material (2.45 g) was chromatographed on an 8 x 15 cm Prochrom column packed with Kromsil CHI 10 chiral phase using an eluent mixture of 3A alcohol and dimethylethylamine in heptane to provide the individual diastereomers in pure form: 1H NMR consistent with product; MS (ion spray) 592 (M+1); Anal. Compound 62 (Isomer 1) To a solution of the purified isomer in ethyl acetate was added a saturated solution of hydrochloric acid in ethyl acetate. The resulting slurry was concentrated to dryness to yield 992 mg (37%) of the desired product as an off-white solid: 1H NMR consistent with product; MS (ion spray) 592 (M+1); Anal. Calcd. for $C_{34}H_{37}N_{7}O_{3} \times 2$ HCl: C, 61.44; H, 5.91; N, 14.75. (Found) C, 59.54; H, 5.92; N, 13.76.

Compound 63 (Isomer 2) To a solution of the purified isomer in ethyl acetate was added a saturated 25 solution of hydrochloric acid in ethyl acetate. resulting slurry was concentrated to dryness to yield 1.17 g (40%) of the desired product as an off-white solid: ¹H NMR consistent with structure; MS (ion spray) 592 (M+1); Anal. Lithium hydroxide (18.1 g, 750 mm, 2 eg) was added to a stirred slurry of ethyl 2-(4-10 nitroimidazoyl)-2-phenylacetate (104 g, 379 mm) in 250 mL of ethanol. Deionized water was added to the resulting mixture and the stirring was continued for 4 hours. The ethanol was removed under vacuum and the resulting aqueous solution was washed with 100 15 mL of diethyl ether. The aqueous layer was diluted with 100 mL of deionized water and the pH was adjusted to 1.8 with concentrated HCl after cooling to 12 °C. The resulting slurry was stirred for 30 minutes at less than 5 degrees and filtered. The 20 wet cake was washed with 100 mL of deionized water and dried under a stream of air on the filter overnight to yield 90.34 g (96%) of a brown solid. The product may be recrystallized from isopropyl alcohol to give 72.31 g (80% recovery, 77% overall 25 yield) of a tan solid. 2-(4-Nitroimidazolyl)-2-phenyl-1-pyrrolidinylethane-1-one

N-Methyl morpholine (22.25 ml, 2 eq) was added to a stirred solution of 2-(4-nitroimidazolyl)-2-10 phenylacetic acid (1) (25.03 g, 101.2 mm) and 2chloro-4,6-dimethoxy-1,3,5-triazine (18.1 g, 101.2 mm, 1.0 eq) in 50 ml of anhydrous tetrahydrofuran at 25°C. After stirring the reaction mixture at ambient temperature for 1 h, 7.2 mL (101.2 mm, 1.0 15 eq) of pyrrolidine was added dropwise. The reaction was stirred at room temperature for 2 hours. The reaction mixture was quenched by the addition of 200 mL of ethyl acetate and 200 mL of 1M HCl. layers were separated and the organic layer was 20 washed with 100 mL of saturated sodium bicarbonate solution. The mixture resulting from the bicarbonate wash was diluted 1:1 with deionized water to dissolve the resulting solids and the layers were separated. The organic layer was washed 25 with brine, dried over magnesium sulfate, filtered and the volatiles were removed under vacuum to give a brown foam. This foam was dissolved in methanol,

diethyl ether and methylene chloride. Evaporation of the solvents overnight yielded a brown solid which was slurried in 200 mL of diethyl ether for 4 The resulting slurry was filtered and the 5 cake was washed with diethyl ether. The solids were dried under vacuum overnight to give a cream colored product (21.68 g, 71%) d (d⁶ DMSO):1.69-1.84 (m, 3H), 2.80-2.85 (m, 0.7H), 3.32 - 3.41 (m, 3.6H), 3.64-3.67 (m, 0.7H), 6.65 (s, 1H), 7.42-7.50 (m, 5H), 7.83 (s, 1H), 8.22 (s, 1H)

Ethanol (200 mL) was added to a mixture of 2-(4-nitroimidazolyl)-2-phenyl-1-pyrrolidinylethan-1one (3) (0.752 g, 2.8 mm) and 10% Pd on carbon (75 mg) in a Bradley hydrogenation apparatus. The stirred reaction mixture was subjected to a 60 psi H_2 atmosphere and warmed to 60 $^{\circ}$ C. After 2 hours, the reaction mixture was cooled to room temperature and the catalyst was removed by filtration. Anhydrous HCl gas was added to the filtered solution until saturation. The volatiles were then removed under vacuum to give a light yellow foam. Diethyl

ether and methylene chloride (25:1) were added to

the foam and the resulting mixture was stirred overnight to achieve crystallization. The resulting slurry was filtered and the cake was washed with diethyl ether. The cake was dried under vacuum to give 0.659 g (93%) of a yellow solid. LGD 208.

Pituitary Cell Culture Assay for Growth Hormone Secretion

- 25 Thirty-two 250 g male Sprague-Dawley rats were used for each assay. The animals were killed by decapitation and anterior pituitaries were removed and placed into ice cold The pituitaries were sectioned into eighths culture medium. and enzymatically digested using trypsin (Sigma Chemical) to weaken connective tissue. Pituitary cells were dispersed by 30 mechanical agitation, collected, pooled and then seeded into 24-well plates (300,000 cells/well). After 4 days of culture, the cells formed an even monolayer. Cells were then washed with medium and challenged to secrete GH by the addition of GH secretagogues to the medium. After 15 min at 35

37 °C, the medium was removed and stored frozen until radioimmunoassays for rat GH were performed. Doses of secretagogue were added in quadruplicate. Representative data is provided in Table 1 below. Compounds disclosed herein are active in the assay as described. Both EC₅₀ and efficacy values were calculated by the 4-parameter logistic equation. Such values were pooled and represented as mean +/- standard error, when appropriate.

We claim:

1. A compound of Formula I

5

10

wherein:

R¹ is C₆H₅CH₂OCH₂-, C₆H₅(CH₂)₃- or indol-3-ylmethyl; Y is pyrrodidinyl, 4-methyl piperidinyl or NR2R2; R2 are each independently a C₁ to C₆ alkyl; R3 is 2-napthyl or phenyl para-substituted by W; W is H, F, CF₃, C₁-C₆ alkoxy or phenyl; and R4 is H or CH₃,

or a pharmaceutically salt or solvate thereof.

- 15 2. A compound of Claim 1 wherein R4 is CH3.
 - 3. A compound of Claim 1 wherein said compound has the (R,R) stereo configuration.
- 20 4. A method for increasing the level of endogenous growth hormone in a human or an animal which comprises administering to said human or animal an effective amount of a compound of Claim 1.
- 25 5. A method for the treatment or prevention of a physiological condition which may be modulated by an increase in endogenous growth hormone which comprises

administering to an animal in need of said treatment an effective amount of a compound of Claim 1 or a pharmaceutically acceptable salt or solvate thereof.

5 6. A pharmaceutical formulation which comprises, as an active ingredient a compound of Claim 1, or a pharmaceutically acceptable salt or solvate thereof, associated with one or more pharmaceutically acceptable carriers, diluents, or excipients.

10

- 7. A pharmaceutical formulation according to Claim 6 which further comprises a bone-antiresorptive agent.
- 8. A method according to Claim 7 which further comprises
 15 administering to a patient a bone antiresorptive agent.
 - 9. A method according to Claim 8 wherein said bone antiresorptive agent is a bisphosphonate.
